Growth or Spending? Calgary's Proposed 15% Property Tax Increase

A ward-level analysis of growth, spending, property assessments and amenity provision, 2021–2030

Data pulled 13 November 2026 · Code and data: github.com/hassanaliarshad110/calgary-data-desk, frozen snapshot branches `taxstudy-v1.3` (scripts, commit a7fce24) and `taxstudy-v1.3-data-p1/p2/p3` (raw data) · Independent audit: 5 passes (Section 5)

Abstract

On 10 November 2026 City administration proposed raising municipal property tax from existing properties by 15% in 2027, then 10%, 7.7% and 6% (compounded +44.4% to 2030). We combine the City's 2027–2030 budget open data, 384 business cases, the full assessment roll (2023–2026, matched home by home), and modelled ward population estimates from the calgaryinsight.ca growth model to address four questions: (1) does the increase track growth and inflation, (2) who would bear it, (3) where growth and amenity inventories diverge, and (4) what 10% or 5% would mean in dollars. Population growth combined with consumer inflation produces a comparison benchmark of +15.6% over 2026–2030, against a proposed cumulative tax-revenue increase of +44.4%; over 2027–2030 the tax steps (+25.6%) track operating spending (+26.8% City data). Real operating spending per resident rises 13.9% (2027–2030) including the water utility and 6.7% without it. Because Calgary taxes homes at one rate, the 15% revenue increase translates to roughly +18% for semi-detached homes, +16% for detached and +8% for condo apartments (indicative, back-tested error up to 2.7 points). On modelled estimates, five wards absorbed 51% of population growth since 2021; they have lower amenity provision by site count per resident than the other nine (amenity provision by inventory count: 33% fewer transit stops and 73% fewer City recreation sites per resident), which is not a measure of capacity or service quality. The study does not argue for or against the increase. It compares the proposed tax trajectory with population growth, inflation and operating expenditure, examines the distribution of estimated tax changes across property types and wards, and identifies areas where growth and amenity inventories diverge.

Three different "increases"

Level	What it measures	2027 figure	Source
Citywide revenue	Municipal property tax levied on existing properties (budgeted revenue, homes and businesses)	+15% (~$384M)	City (proposed)
Residential tax rate	Rate per dollar of assessed value applied to homes	about +19% (18.7–19.5%)	Our inference from City typical-home figures
Individual bill	Your bill = your assessment × the rate; depends on how your assessment moved	Typical home +16%; by type about +8% to +18% (modelled, ±3 pts)	City (typical home); our estimate (types)

The 15% figure is the first row only. It is not the change on every bill.

Executive conclusion

The evidence establishes	The evidence does not establish
The proposed tax path (+44.4% to 2030) is about three times population growth plus consumer inflation (+15.6%) over the same years.	That spending above that benchmark is unnecessary. City costs also rise with wages, construction prices, ageing infrastructure and service obligations.
From 2027, tax steps (+25.6%) and operating spending (+26.8% to +31.9%) move together; 43% of the spending increase is the water utility, which is rate-funded.	Which specific programs should be funded or cut. The 10% and 5% gaps are scale comparisons, not cut lists.

The evidence establishes	The evidence does not establish
Because homes share one tax rate, semi-detached and detached owners would likely pay more than 15% and condo owners less, as already happened on 2026 bills.	Any individual 2027 bill. 2027 assessments are unpublished; type estimates carry about ±3 points of uncertainty.
On modelled estimates, growth since 2021 is concentrated (five wards, 51%), and those wards have fewer transit stops and recreation sites per resident.	Service failure or lower service quality. Site counts do not measure capacity, and lower 311 rates are not evidence of better service.

1. Research questions

#	Question	Primary evidence	Section
Q1	Is the increase explained by population growth and inflation?	City population/CPI forecasts; budget open data; Herald totals	4.1–4.2
Q2	Who pays more or less than 15%?	Assessment roll 2023–2026 matched by roll number; CREB benchmarks; tax bylaw	4.3
Q3	Where did growth happen and is service pressure visible?	Growth model by community/ward; 311; City asset inventories	4.4–4.5
Q4	What do 10% or 5% mean in dollars?	City typical-home figures; $25.6M per 1%; business-case totals	4.6

2. Data

Source	ID / document	Coverage	Records used
City 2027–2030 Budget (open data)	nnnm-9sfh	Operating (net of recoveries) and capital, by dept/BU, 2027–2032	1,392 rows
Budget request business cases	City PDF, 792 pp. (SHA-256 in README)	All operating and capital requests, Nov 2026	384 cases (124 op, 260 cap)
Current-year assessment roll	4bsw-nn7w	2026 roll (valued 1 Jul 2025)	501,999 RE rows; 499,455 roll numbers
Historical assessment roll	4ur7-wsgc	Roll years 2023–2025	469,439 / 477,666 / 491,208 rows
2026 Property Tax Bylaw 9M2026	Alberta Municipal Affairs	Rates and levy by class	residential rate 0.0038906
Growth model (calgaryinsight.ca)	population.py, dashboard.py	Homes × 2021 Census people per home, scaled to City total	14 wards, residential communities
311 service requests; City assets	311 data; hxfu-6d96 (recreation); parks; transit stops	Nov 2024–Oct 2026	per ward
City Economic Outlook	Spring 2026 Table 4; Fall 2026 Table 1	Population 2021–2030; CPI 2021–2030	—
CREB monthly statistics	Calgary packages, Jul 2025 / Jul 2026	Benchmark price YoY by type	5 types × 2 years
Press	Calgary Herald (10 Nov), Global News (2 Sep), CTV, LiveWire	2026 base, 2028–30 steps, $25.6M per 1%	cited inline

Collection: three GitHub Actions jobs (branches taxstudy-probe, taxstudy2-probe, taxstudy3-probe) queried the City portal on 13 Nov 2026 and committed raw outputs to the matching "-out" branches. Historical roll codes (e.g. RE0110, RE0410) were mapped to current codes (R110, R402) by cross-tabulating roll numbers present in both 2025 and 2026; leading zeros were stripped on both rolls.

3. Methods

3.1 Population

Homes = assessment roll, class RE, property type LI, sub-property use R*, by community and year built. Residents from new homes = homes × 2021 Census people per home (+ rentals). The main view scales every community's 2021 count by one factor (1.1001 on this run) and adds measured new-home growth so the sum equals the City's monthly estimate (straight line between April figures). Communities are assigned to the ward holding most of their area. The Census-based residential-community population (1,288,995) is about 2.5% below the City's April 2021 estimate (1,321,600). Ward estimates incorporate a uniform citywide scaling adjustment to align the two; this is not a ward-specific measurement of Census undercoverage. Ward figures are modelled estimates, not official ward counts. The City publishes a citywide estimate and forecast as of April each year, not ward populations; our ward totals sum the residential communities assigned to each ward and are interpolated to the month (November 2026). Community-to-ward assignment: each community goes wholly to the ward that contains most of its area (City community and ward boundary files); communities split by a ward boundary therefore count entirely in one ward.

3.2 Spending benchmarks

Per-resident spending = budget ÷ City April population of the same year; real = ÷ compounded City CPI forecast. Spans are matched (2026→2030 four steps; 2027→2030 three steps). The City's 2027–2030 open data is not comparable with 2023–2026, so the 2026 base uses Calgary Herald totals ($5.118B 2026, $5.963B 2027, $7.867B end of cycle). Water Services (and Waste & Recycling) are shown separately because they are funded mainly through utility rates, not property tax. Population plus consumer inflation is a comparison benchmark only: it is not a measure of justified spending, and spending above it is not by itself evidence of waste. City cost drivers (collective agreements, construction prices, ageing assets, new service obligations) can run above consumer inflation.

3.3 Who pays: rate-multiplier rule

From the City's typical home (tax $229.32 → $266; value $706,000 → $688,000):

```
R = (266 / 229.32) / (688,000 / 706,000) = 1.1903 [range 1.1881–1.1925]
bill change(g) = (1 + g) × R − 1 break-even g = 1.15 / R − 1 = -3.39%
g(type) = −2.55% + (CREB_Jul2026(type) − CREB_Jul2026(detached))
ward change = Σ v·r·(1+g_type)·R / Σ v·r − 1 over every home on the 2026 roll, r = 0.0038906
```

Baseline. The central estimate uses $229.32, the City's published 2026 monthly City tax for its typical single residential property (2026 budget adjustments, calgary.ca/adjustments). Recomputing that bill from the final 2026 bylaw rate gives 706,000 × 0.0038906 ÷ 12 = $228.90. The City's figure was published with the 2026 budget adjustments, before the final bylaw rate was set (March 31, 2026), which likely explains the $0.42 gap. $228.90 is used only as a sensitivity test: it moves R from 1.1903 to 1.1925 (+0.2 points). The $1 rounding of the City's $266 moves R by ±0.2 points.

R is inferred, not published. A rate rise above 15% can come from a falling residential base, a change in the residential/non-residential split, or both. CREB 'row' is applied to R401/R402 and 'apartment' to R201/R202/R301/R302; other residential codes use CREB total residential. Validation: the same anchoring applied to CREB July 2025 is compared with the actual 2025→2026 same-home medians (Section 5).

3.4 Paired assessment change

Change = value(t) / value(t−1) − 1 for the same roll number and the same home type; medians and interquartile ranges by type. 2025→2026: 486,475 matched accounts, 485,541 with the same type.

3.5 Service pressure

Transit stops and recreation sites: all sites in each ward divided by the ward's modelled residents (one base for counts and rates). Park hectares and 311 rates: per 1,000 residents of residential communities (311 uses mid-period residents), averaged across wards weighted by residents. The five fastest-growing wards (by modelled growth) are compared with the other nine. Counts measure sites, not size, quality or frequency of service.

4. Results

4.1 The tax path against growth and inflation

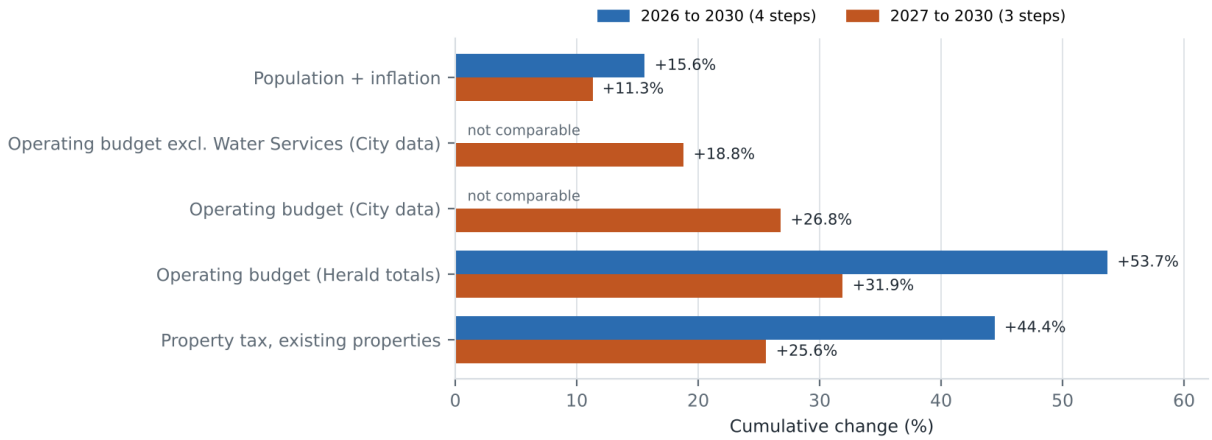

Figure 1. Cumulative change on matching spans. Sources: City Economic Outlook (population, CPI); City budget open data; Calgary Herald; proposed tax path.

Over 2026–2030 the tax path is about three times population plus inflation. From 2027 the tax steps (+25.6%) and operating spending (+26.8% to +31.9%) move together, both more than double population plus inflation (+11.3%). Excluding Water Services, which is funded mainly through utility rates and accounts for 43.1% of the increase, City-data operating expenditure rises +18.8% ($5,211.6M to $6,191.3M). This still does not show how much of the remaining spending is funded by property tax; that would need a funding-source reconciliation the City has not published. The 2026→2027 jump in the Herald operating total is +16.5%. July documents (Global News) put the increase needed only to maintain services in 2027 at 5.4%. The benchmark shows scale, not whether spending is justified (Section 3.2).

4.2 Spending per resident and where it grows

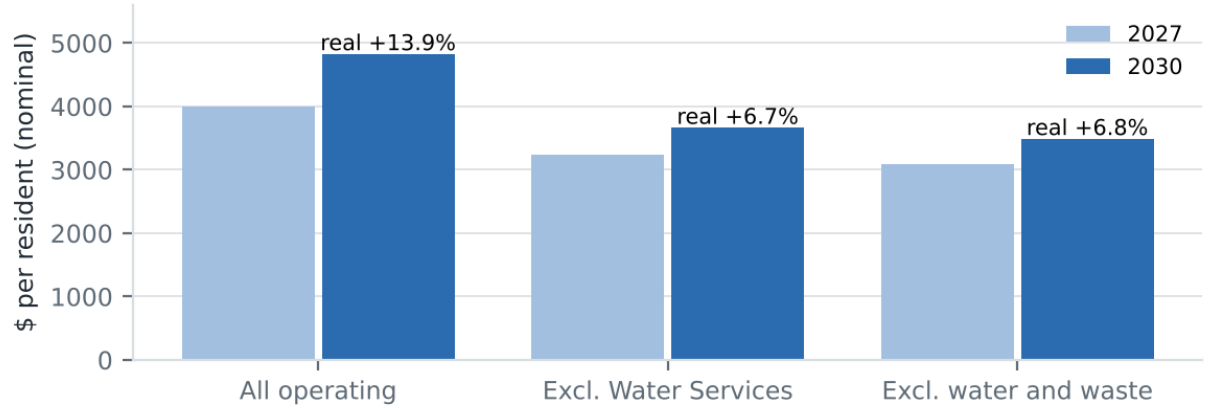

Figure 2. Operating spending per resident, City data (net of recoveries). Real growth deflated by City CPI forecast 2028–2030 (+6.0%).

Business unit	2027 ($M)	2030 ($M)	Change ($M)
Water Services	1,222.0	1,965.3	+743.3
Corporate Programs	900.6	1,480.0	+579.4
Calgary Transit	659.9	823.6	+163.7
Mobility	379.8	447.6	+67.8
Calgary Police Service	742.2	809.5	+67.3
Emergency Management & Community Safety	184.7	231.3	+46.6

Business unit	2027 ($M)	2030 ($M)	Change ($M)
All	6,433.6	8,156.6	+1,723.0

Water Services is 43.1% of the operating increase. New ongoing requests total $595.6M (four years): explicit Council direction $256.5M, implicit $153.9M, risk-based $129.1M, provincial changes $28.2M, Police Commission $27.9M; 1,926 FTEs.

Capital requests ($13.05B, 2027–2031) by City purpose tag: maintenance 42.4%, growth 34.6%, enhancement 20.3%, transformative 2.7%. Utilities Delivery is $5.87B (45.0%); excluding it, maintenance is 58.8%. Only 34 of 260 requests (8.2%) carry a ward tag; the correlation between residents added and ward-tagged capital is 0.23 (tags record location, not benefit).

Capital periods. The business cases request $13.05B for 2027–2030 (plus $26.7M scheduled for 2031 and later, hence '2027–2031'). The City's $21B headline is the four-year capital plan: these new requests plus capital approved in earlier budgets (the open data lists $6.9B approved for 2027–2030). The two figures overlap in scope and are not compared.

Two spending series, not one. The City's open data (2027–2030, operating expenditures net of recoveries) and the Calgary Herald totals (2026 base and end-of-cycle total operating budget) use different accounting scopes, and no reconciliation between them has been published. They are reported side by side as separate comparisons and are never joined into one trend.

4.3 Who pays more than 15%

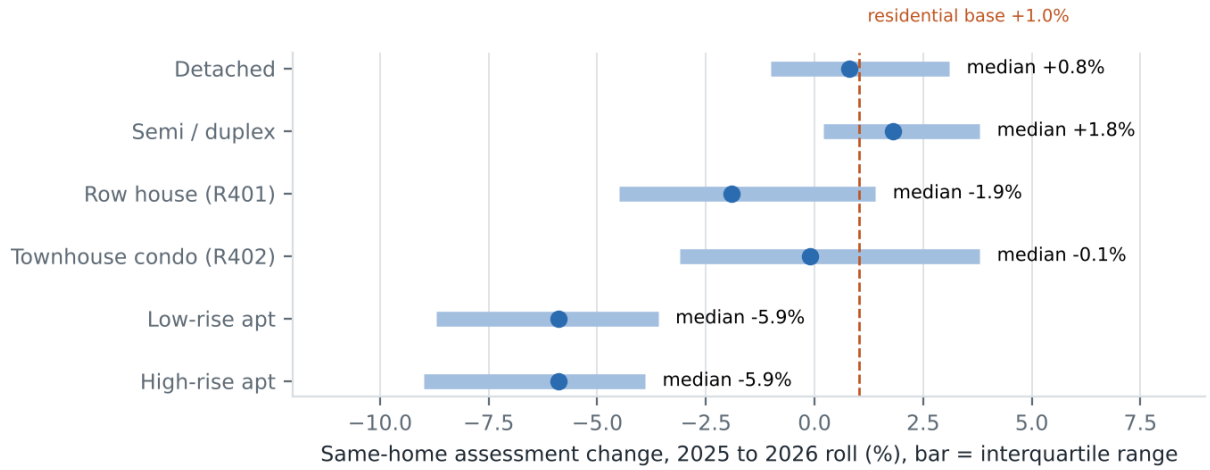

Figure 3. Same-home assessment change by type, 2025→2026 roll (valuation dates 1 Jul 2024 → 1 Jul 2025). Dot = median; bar = interquartile range.

Home type	Homes 2026	Median value	Median Δ 25→26	Δ 23→26	Share above base
Detached house	306,536	$718,000	+0.8%	+26.7%	46%
Semi-detached / duplex	36,820	$580,000	+1.8%	+27.4%	63%
Row house / townhouse (code R401)	12,760	$519,500	-1.9%	+33.6%	27%
Townhouse condo (code R402)	49,917	$427,000	-0.1%	+39.9%	41%
Low-rise condo apartment	51,411	$291,000	-5.9%	+43.2%	9%
High-rise condo apartment	29,723	$329,500	-5.9%	+22.2%	6%

Home type	CREB Jul-2026 YoY	Assumed 2027 assessment Δ	Modelled 2027 City tax Δ (central)	Range (±3 pts)
Semi-detached	-0.30%	-0.98%	+17.9%	+15% to +21%
Detached	-1.87%	-2.55%	+16.0%	+13% to +19%
Row	-6.10%	-6.78%	+11.0%	+8% to +14%
Apartment condominium	-8.37%	-9.05%	+8.3%	+5% to +11%

Modelled municipal tax changes for each home type, not confirmed individual bills. The range reflects the back-tested error of the CREB proxy (up to 2.7 points).

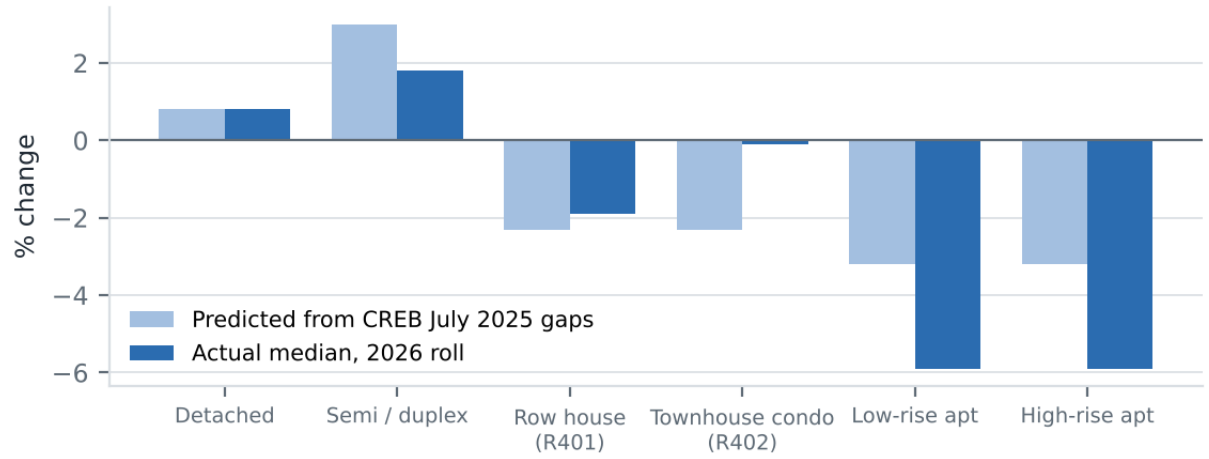

Figure 4. Back-test of the anchoring method on the 2026 roll. Errors: semi +1.2, row codes −0.4 / −2.2, apartments +2.7 points. Direction correct for every type; CREB understated the condo apartment decline.

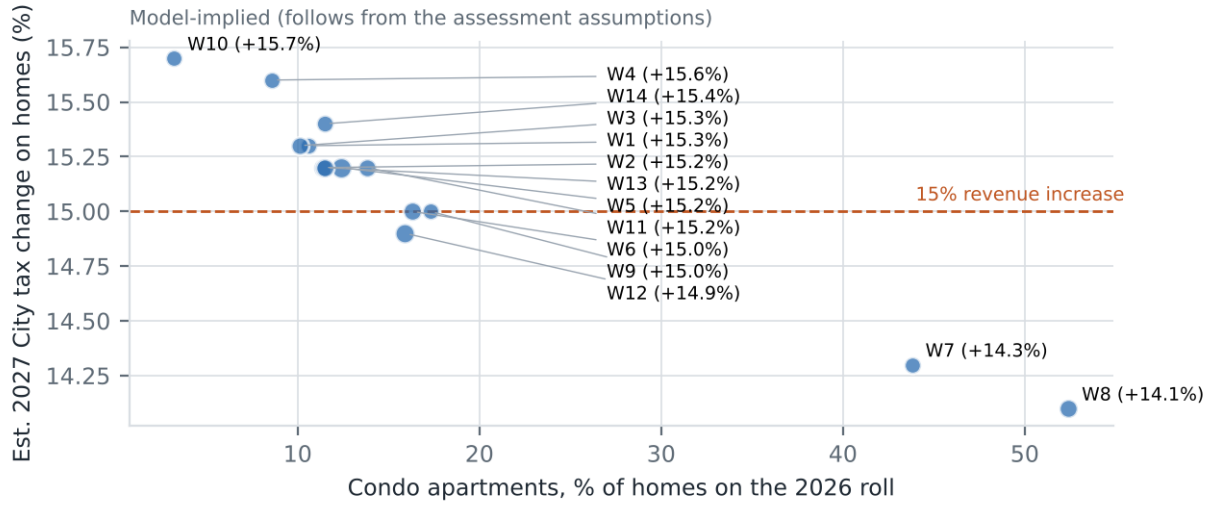

Figure 5. Model-implied relationship, not independent evidence: the model assumes condo apartment assessments fall more than houses, so wards with more condo apartments are estimated to get smaller increases. Citywide check: +15.0%. Sensitivity: with raw CREB changes (no anchoring) wards range +14.9% to +16.5%; with apartments a further 2.7 points lower (the back-test error) +13.4% to +15.6%. In both, Wards 8 and 7 stay lowest and Wards 10 and 4 highest.

4.4 Growth by ward

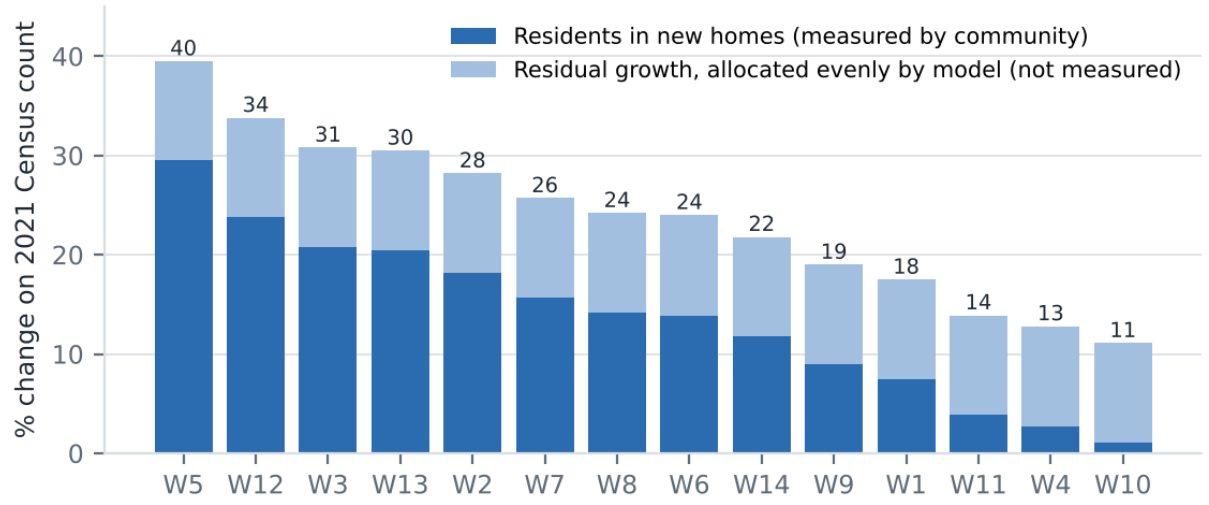

Figure 6. Modelled estimate (not an official ward count). Dark: residents in new homes, measured by community. Light: growth new homes do not explain, allocated evenly by the model (not measured by ward); it includes the uniform scaling to the City's 2021 estimate. Like-for-like citywide growth on the City's estimates: +20.9%. Residents are rounded to the nearest 100.

Allocation sensitivity. Share of added residents in the five fastest-growing wards (5, 12, 3, 13, 2) under different allocations of growth that new homes do not explain: even by 2021 population (main) 50.8%; equal per ward 50.2%; proportional to new-home growth 60.5%. The finding that about half or more of growth went to these five wards holds under all three.

Ward	Residents now (model)	2021 Census	Δ (Census base)	Δ new homes	Homes added	Share of added	Res. tax / resident	Est. 2027 Δ	Condo apt %
1	102,700	87,400	+17.5%	+7.5%	2,523	4.9%	$964	+15.3%	10.6%
2	121,600	94,840	+28.2%	+18.2%	7,256	8.7%	$826	+15.2%	11.4%
3	112,000	85,640	+30.8%	+20.8%	5,960	8.5%	$747	+15.3%	10.1%
4	100,100	88,740	+12.8%	+2.7%	1,151	3.7%	$853	+15.6%	8.6%
5	148,100	106,185	+39.5%	+29.5%	9,018	13.6%	$567	+15.2%	12.4%
6	121,700	98,160	+24.0%	+13.9%	5,796	7.6%	$1,062	+15.0%	16.3%
7	97,600	77,670	+25.7%	+15.7%	6,011	6.4%	$1,116	+14.3%	43.8%
8	118,900	95,750	+24.2%	+14.2%	7,653	7.5%	$1,181	+14.1%	52.4%
9	100,400	84,380	+19.0%	+9.0%	3,322	5.2%	$685	+15.0%	17.3%
10	99,300	89,440	+11.1%	+1.1%	467	3.2%	$557	+15.7%	3.2%
11	116,700	102,440	+13.9%	+3.9%	1,859	4.6%	$958	+15.2%	13.8%
12	135,000	100,875	+33.8%	+23.8%	9,557	11.0%	$859	+14.9%	15.9%
13	118,900	91,120	+30.5%	+20.5%	6,910	9.0%	$831	+15.2%	11.5%
14	105,200	86,355	+21.8%	+11.8%	4,143	6.1%	$920	+15.4%	11.5%
City	1,598,100	1,288,995	+24.0%	+14.0%	71,626	100%	$863	+15.0%	17.5%

4.5 Amenity provision by inventory count, and 311

Measure	Five fastest (W5, 12, 3, 13, 2)	Other nine	Difference
Transit stops per 1,000 (all stops in ward ÷ residents)	2.99	4.47	-33%
City recreation sites per 100,000 (all sites in ward ÷ residents)	2.67 (17 sites / 635,573)	9.87 (95 / 962,502)	-73%
Local park ha per 1,000 (residential communities, resident-weighted)	2.46	2.79	-12%

Measure	Five fastest (W5, 12, 3, 13, 2)	Other nine	Difference
311 requests per 1,000 a year (resident-weighted)	201	314	-36%

Interpretation: the five fastest-growing wards have lower amenity provision by inventory count per resident. Counts do not measure capacity, size, quality or accessibility; one large complex counts the same as a small facility. 311 request rates are lower in the fastest-growing wards. This should not be interpreted as evidence of better service delivery or lower infrastructure pressure: request rates also reflect reporting habits, awareness of 311, access and the age of the housing stock.

A transit stop is not a measure of frequency or capacity; a recreation site is not a measure of size; park hectares do not measure access or upkeep; 311 requests are not a count of infrastructure failures. Ward-level correlations with growth (n = 14, descriptive only): transit stops -0.71 (dropping the fastest ward -0.64, the two fastest -0.53, leave-one-out -0.83 to -0.64); recreation -0.55 (-0.52, -0.46; -0.68 to -0.47); 311 rate -0.29 (-0.2, -0.11; -0.49 to -0.2). The transit and recreation associations keep their sign and weaken but do not vanish when the fastest wards are removed; the 311 association is weak. Citywide 311: 269.2 per 1,000 (prev. 271.6).

4.6 Scenarios for 2027

These are revenue gaps against the proposed 15%, not savings or cuts. They do not show that spending could fall by these amounts without affecting services. All dollar amounts are estimates based on the reported figure of about $25.6M per percentage point, assumed constant across scenarios; the City has not published a scenario table, and our own estimate from the 2026 levy is $25.2M per point.

2027 increase	Est. revenue (at $25.6M per 1%)	Typical home $/month	Δ vs 2026 /month	Δ /year	Revenue gap against the proposed 15%	Gap as % of new 2027 requests (all / ongoing)
15%	$384M	$266.00	+$36.68	+$440	—	—
10%	$256M	$254.43	+$25.11	+$301	$128M	36.1% / 46.4%
5%	$128M	$242.87	+$13.55	+$163	$256M	72.2% / 92.7%

Four-year path on the typical home: $229 → $266 → $293 → $315 → $334 a month (+$1,257/yr by 2030; +34.4% real). The gap ratios are a scale comparison, not a cut list: the 15% also funds cost growth in the existing budget.

How the scenarios are calculated: revenue = increase × $25.6M per 1% (reported City figure). Typical-home bill = $229.32 × (1 + increase) × 1.0087, where 1.0087 = 266 ÷ 229.32 ÷ 1.15 is the City's own ratio between its typical-home change and the 15% revenue change; it is held constant across scenarios. Denominators for the gap ratios: all new 2027 requests = $276.1M ongoing + $78.6M one-time = $354.7M (e.g. $128M ÷ $354.7M = 36.1%); ongoing only = $276.1M ($128M ÷ $276.1M = 46.4%). Both come from the totals of the City's 384 business cases.

5. Validation and sensitivity

Check	Result
Independent re-run of all scripts	Figure files byte-identical (auditor pass 1 and 2)
Rate multiplier R	1.1881–1.1925 from $1 rounding of $266 and the 2026 bylaw rate ($228.90/month); reported as ~19% (18.7–19.5%)
Anchoring consistency	Type changes applied to every home give a citywide residential increase of +15.0% (target 15%)
CREB back-test (2026 roll)	Direction correct for all types; absolute error ≤ 2.7 points; apartment decline understated
Population base	Census base vs City 2021 estimate: −2.5%; like-for-like growth +20.9% (vs +24.0% on Census base)
Matched spans	All growth benchmarks compared over identical year spans (2026→2030, 2027→2030)
Population allocation	Five-ward share of growth 50.2% to 60.5% across allocations of residual growth
Ward tax ranking	Wards 8 and 7 lowest, 10 and 4 highest under the central, raw-CREB and apartments −2.7-point assumptions
Correlation robustness	Transit and recreation associations keep their sign after dropping the fastest one or two wards and under leave-one-out; n = 14

Check	Result
Recreation rate	Count and rate on one base (all sites ÷ ward residents): 17 ÷ 635,573 = 2.67 per 100,000
Audit	Pass 1 (Claude Fable): 7 high, 12 medium, 3 low findings, all addressed. Pass 2: 1 new error (span mismatch) and 4 minor, fixed. Pass 3 (external review of the PDF, 8/10): baseline, terminology, 311 interpretation, model qualification and amenity wording, all addressed in v1.1. Pass 4 (second external review): recreation base, levied vs collected, model-implied correlation, Census wording, population and correlation sensitivity, capital periods, spending series, ±3-point ranges, gap labelling; all addressed in v1.2. Pass 5 (third external review, 9/10): operating growth excluding water, four questions, subtitle, abstract scope, $25.6M qualification, full links and frozen snapshot branches; all addressed in v1.3

6. Limitations

1. 2027 assessments are unpublished (roll mailed January 2027); type and ward bill changes are indicative proxies (±3 points).

2. R is inferred from rounded City figures; the residential/non-residential split for 2027 is unknown.

3. 2028–2030 tax steps, the $25.6M per 1% and the 2026 operating base come from news reports, not City documents we could read.

4. Ward populations are model estimates; growth not explained by new homes is spread evenly and is not measured by ward.

5. Amenity counts measure sites, not capacity or service frequency; correlations use n = 14 and are descriptive.

6. Ward capital tags record location, not benefit, and cover 8.2% of requests.

7. R401/R402 home-type labels are inferred from value, zoning and building age, not from a City code list.

8. Consumer inflation is used as a benchmark; City cost inflation (wages, construction) can differ.

9. Property tax figures are tax levied (billed), estimated from the roll and the 2026 bylaw, not tax collected.

7. Reproducibility

Repository: github.com/hassanaliarshad110/calgary-data-desk. Frozen snapshot branches (not updated after release): `taxstudy-v1.3` at commit `a7fce24` (scripts, figure files, this report builder) and `taxstudy-v1.3-data-p1` (d050cc6), `-p2` (7e1713b), `-p3` (56cc601) (raw probe outputs pulled 13 Nov 2026). Requirements: Python 3.12+ (standard library for the analysis; matplotlib and reportlab for the PDF) and a checkout of the main branch.

```
git clone -b taxstudy-v1.3 https://github.com/hassanaliarshad110/calgary-data-desk.git ta
for b in taxstudy-v1.3-data-p1:p1 taxstudy-v1.3-data-p2:p2 taxstudy-v1.3-data-p3:p3; do
  git clone -q --depth 1 -b ${b%%:*} https://github.com/hassanaliarshad110/calgary-data-desk.git
ta/taxstudy/${b##*:}; done
cd ta/taxstudy && export STUDY=$(pwd) REPO=/path/to/calgary-data-desk
python3 analysis_budget.py && python3 analysis_assess.py && python3 analysis_wards.py
```

Script	Output	Feeds
probe/taxstudy.py	p1/ (dashboard build, tax by community)	Growth, 311, amenities, tax per resident
probe/taxstudy2.py	p2/ (2026 homes, budget open data)	Operating/capital budget
probe/taxstudy3.py	p3/ (rolls 2022–2026 by roll number)	Paired changes, back-test, ward bill change
analysis_budget.py	fig_budget.json	Sections 4.1, 4.2, 4.3 (rule), 4.6
analysis_assess.py	fig_assess.json	Section 4.3 (paired, back-test)
analysis_wards.py	fig_wards.json	Sections 4.3 (ward), 4.4, 4.5

Hard-coded inputs and their sources are listed in taxstudy/README.md. Ward figures move slightly with the run date because the City total is interpolated monthly.
